

Student program

The purpose of the program is to establish a continuous collaboration with students that extends throughout the education, and which after graduation can potentially result in a permanent employment at Höganäs.

Approach

The program begins with summer work in one of Höganäs' production or laboratory facilities, where students gain experience and a broader understanding of our business. The following summers during the study period, the student gets the opportunity to work on specific projects and tasks in product development and production. There may also be additional opportunities for more hands-on work experience during school hours, depending on studies and availability.

A dedicated mentor follows the student throughout the program and also gets the opportunity to do their degree project within Höganäs.

Who are we looking for?

We are looking for students who are ambitious, eager to learn and develop, and who are ready to undertake a long-term collaboration with Höganäs until graduation and possibly move on, including every summer and during the degree project. We also expect the student to be a strong ambassador for Höganäs at its university.

The internships are based in Höganäs, Sweden, and we are mainly looking for students at the beginning of their studies in the following areas:

- Material design
- Chemistry
- Machine construction
- Electrical engineering
- Automation
- Physics
- Economy
- Logistics
- Legislation
